

Precision Bandsaw Fence Product Data Sheet

A precision fence increases the usefulness of Forrest saws by serving as a rip guide, precision workpiece positioning tool, and squaring tool. The precision fence is available as an option on all vertical bandsaws. The fence will improve your accuracy when making cuts and will greatly speed production when making multiple cuts to the same setting.

The fence is moved by turning a handwheel. The motion of the table is synchronized with gear racks on both ends of the fence, guaranteeing smooth, accurate and square motion of the fence. Available as an option is an Electronic Digital Readout. This readout will show the distance from the fence face to the blade in inches or millimeters. It can also be programmed to show offset distance from last cut.

The standard precision fence includes an 8 inch high, painted steel face. Other options include larger fence faces, aluminum or stainless steel faces, or special fence faces such as one covered with vacuum cups.

A precision fence is a common and versatile attachment for locating a workpiece on a bandsaw. For other applications special workholding fixtures may be necessary. Please contact Forrest and we will be happy to work with you to design a saw and fixture for your specific application.
